

# NUMPY

# Why Numpy

- Provides efficient storage
- Meant for creating homogeneous n dimensional array
- Better ways of handling data for Mathematical Operations
- Linear algebra, Statistical operations, Matrix operations
- Shapes manipulation.
- Random number generation
- Building block for other packages

# Importing Package

- Importing the package
  - *import numpy*
- Importing the package with alias
  - *import numpy as np*
- Importing a function from package
  - *from numpy import mean*
- Importing a packages from package
  - *from numpy import random*
  - *from numpy import linalg*
- Importing all
  - *from numpy import \**

# Array Creation

- From List
  - `np.array([7,2,9,10])`
- From Tuple
  - `np.array((20,30,14))`
- Generating array elements in Given Range
  - `np.arange(10)`
  - `np.arange(2, 3.2, 0.1)`
  - `np.linspace(1, 3, 15)`
- Multidimensional arrays

1D array

axis 0

shape: (4,)

2D array

axis 1

shape: (2, 3)

3D array

shape: (4, 3, 2)

# Array creation - using numpy functions

- Initialized

- `np.zeros((2,2))`
- `np.ones((1,2))`
- `np.full((2,2), 7)`

0.	0.
0.	0.

1.	1.
----	----

7	7
7	7

- Uninitialized

- `np.empty((2,3))`

- Diagonal values

- `np.eye(2)`
- `np.diag([4,5,6,8])`

1.	0.
0.	1.

4	0	0	0
0	5	0	0
0	0	6	0
0	0	0	8

# NumPy dtypes

Basic Type	Available NumPy types	Comments
Boolean	<code>bool</code>	Elements are 1 byte in size
Integer	<code>int8</code> , <code>int16</code> , <code>int32</code> , <code>int64</code> , <code>int128</code> , <code>int</code>	<code>int</code> defaults to the size of <code>int</code> in C for the platform
Unsigned Integer	<code>uint8</code> , <code>uint16</code> , <code>uint32</code> , <code>uint64</code> , <code>uint128</code> , <code>uint</code>	<code>uint</code> defaults to the size of unsigned <code>int</code> in C for the platform
Float	<code>float32</code> , <code>float64</code> , <code>float</code> , <code>longfloat</code> ,	Float is always a double precision floating point value (64 bits). <code>longfloat</code> represents large precision floats. Its size is platform dependent.
Complex	<code>complex64</code> , <code>complex128</code> , <code>complex</code>	The real and complex elements of a <code>complex64</code> are each represented by a single precision (32 bit) value for a total size of 64 bits.
Strings	<code>str</code> , <code>unicode</code>	Unicode is always UTF32 (UCS4)
Object	<code>object</code>	Represent items in array as Python objects.
Records	<code>void</code>	Used for arbitrary data structures in record arrays.

# Normal(or Gaussian) Distribution or Bell curve

- The curve is symmetric about mean.
- The mean, median, and mode are all Equal.
- Half of the population is less than the mean and half is greater than the mean.

# Array creation - using random package

- `np.random.randint(20), np.random.randint(2, 20)`
- `np.random.randint(2, 20, 7), np.random.randint(2, 20, (3,2))`
- `np.random.random((2,2))`
- `np.random.rand(4), np.random.rand(4,3)`
- `np.random.randn(2), np.random.randn(2, 4)`

# Subsetting, Slicing & Indexing with 1d array

*# Third element*

```
print(array_1d[2])
```

*# Specific elements*

```
print(array_1d[[2, 5, 6]])
```

*# Slice third element onwards*

```
print(array_1d[2:])
```

*# Slice first three elements*

```
print(array_1d[:3])
```

*# Slice third to seventh elements*

```
print(array_1d[2:7])
```

*# Subset starting 0 at increment of 2*

```
print(array_1d[0::2])
```

# Subsetting, Slicing & Indexing with 2d array

# Fancy Indexing

```
array_1d[[True,False,False,True,True,False,False,True,True,False]]
```

```
# Fancy Indexing Boolean array as index
```

```
array_1d[array_1d>5]
```

# Array Manipulation

- reshape
- flatten
- expand\_dims
- squeeze
- stacking - hstack,vstack
- resize

## Reference

<https://docs.scipy.org/doc/numpy/reference/routines.array-manipulation.html>

# Broadcasting

how numpy treats arrays with different shapes during arithmetic operations.

the smaller array is “broadcast” across the larger array so that they have compatible shapes

Two dimensions are compatible when

- they are equal, or
- one of them is 1

# Reading Image data as ndarray

```
from matplotlib import pyplot as plt
```

```
img = plt.imread("ml.jpg")
```

```
img.shape
```

```
type(img)
```

```
plt.imshow()
```

# Reading sklearn Dataset as ndarray

```
from sklearn.datasets import load_breast_cancer
```

```
data = load_breast_cancer()
```

```
print(data)
```

```
print(data['data'])
```

```
print(data['data'].shape)
```

THANK YOU
